

Switch me off when you leave!

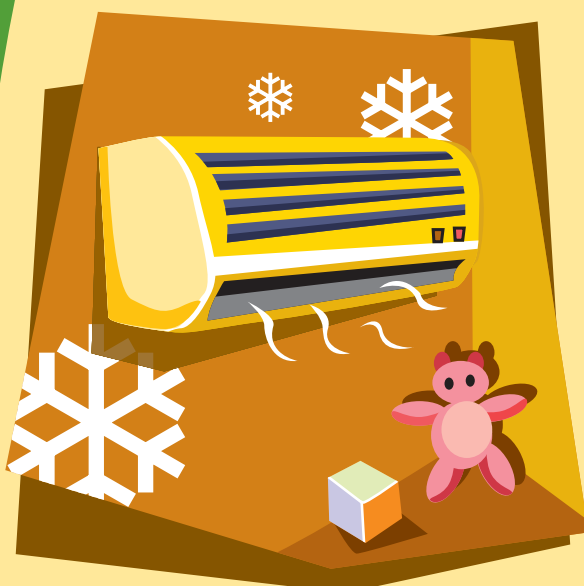

computers

fans

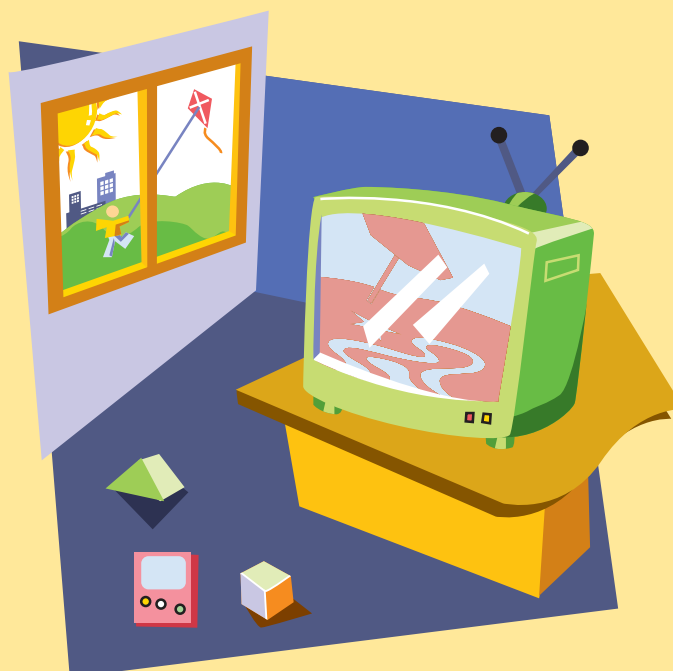

lights

air-conditioning

Close doors and windows when the air-conditioning is on.

Do not overcool an air-conditioned room. Set the temp between 24°C and 25°C.

television

other appliances that consume electricity

Recycle!

Recycling saves energy too!

Do you know?

In Singapore, we make electricity by burning natural gas and oil. When we burn these fuels, pollutants and greenhouse gases are released. Greenhouse gases can trap heat from the sun and keep heat from escaping from the Earth. This causes the Earth to become warmer, which in turn causes climates to change everywhere. Rainfall patterns will change and the sea level will rise because of melting glaciers and polar ice. Humans, plants and wildlife will suffer too.

You can help to make the Earth a better place to live in by using electricity wisely. When we use less electricity, there will be less pollution and greenhouse gases. So do your part by practising good energy conservation habits today! Visit www.neec.gov.sg to find out more about energy efficient appliances with the energy label.
